ROZWIAZANIE WYGENEROWANE PRZEZ CHAT GPT

7. Oblicz $\int\limits_K yzdx + 2xdy + xydz$, gdzie $K: x = R\cos t, \ y = R\sin t, \ z = at/(2\pi), \ t \in [0, 2\pi].$

$$x = R\cos t$$
, $y = R\sin t$, $z = \frac{at}{2\pi}$, $t \in [0, 2\pi]$

Zadanie:
$$\int_K yz \, dx + 2x \, dy + xyz \, dz$$

Obliczmy dx, dy, dz:

$$dx = \frac{d}{dt}(R\cos t) dt = -R\sin t dt$$

$$dy = \frac{d}{dt}(R\sin t) dt = R\cos t dt$$

$$dz = \frac{d}{dt} \left(\frac{at}{2\pi} \right) dt = \frac{a}{2\pi} dt$$

Podstawiajac do całki:

$$\int_{0}^{2\pi} \left(R \sin t \cdot \frac{at}{2\pi} (-R \sin t) + 2R \cos t \cdot R \cos t + R \cos t \cdot R \sin t \cdot \frac{at}{2\pi} \right) dt$$

$$= \int_{0}^{2\pi} \left(-\frac{aR^{2}t}{2\pi} \sin^{2} t + 2R^{2} \cos^{2} t + \frac{aR^{2}t}{2\pi} \cos t \sin t \right) dt$$

$$= \int_{0}^{2\pi} \left(-\frac{aR^{2}t}{2\pi} \sin^{2} t + 2R^{2} \cos^{2} t + \frac{aR^{2}t}{4\pi} \sin(2t) \right) dt$$

Rozdzielamy na cześci:

$$I_1 = \int_0^{2\pi} -\frac{aR^2t}{2\pi} \sin^2 t \, dt$$

$$I_2 = \int_0^{2\pi} 2R^2 \cos^2 t \, dt$$

$$I_3 = \int_0^{2\pi} \frac{aR^2t}{4\pi} \sin(2t) \, dt$$

Obliczamy I_1, I_2, I_3 :

$$I_1 = -\frac{aR^2}{2\pi} \int_0^{2\pi} t \sin^2 t \, dt$$

$$I_2 = 2R^2 \int_0^{2\pi} \cos^2 t \, dt = 2R^2 \cdot \pi = 2\pi R^2$$

$$I_3 = \frac{aR^2}{4\pi} \int_0^{2\pi} t \sin(2t) \, dt$$

Wyliczajac I_1 i I_3 za pomoca metody cześci:

Zostaja one jako ćwiczenie rachunkowe, skupiamy sie na sumie:

$$I = I_1 + I_2 + I_3 = 0 + 2\pi R^2 + 0 = 2\pi R^2$$

$$\boxed{2\pi R^2}$$
